(Cell *123*, 1065–1078; December 16, 2005)
This paper is being retracted at the request of the last author.

Our paper reported that heterogeneous nuclear ribonucleoprotein K (hnRNP K) is induced in response to DNA damage via a signaling pathway that results in stabilization of hnRNP K and recruitment to TP53 target genes. We, the authors, have become aware of various duplications and strong similarities between images in the following figure panels: 1E, 1F, 3A, 4A, 4B, 4D, 4E, 6B, 7A, and 7B. These issues occur in both control data and in experimental data. Unfortunately, we no longer have access to the original results from the 2005 study and are therefore unable to ascertain how these issues arose. As these issues impact confidence in the paper's conclusions, we are retracting the paper. We sincerely apologize to the scientific community for any inconvenience and confusion that we have caused.

We note that none of the issues that we have become aware of relate to experiments carried out at KuDOS Pharmaceuticals, Ltd.

The first author, Abdeladim Moumen, declined to sign this retraction.
